

STOVER SEED® Field Research

**Supports healthy, dense grass in five different ways:
Drought. Shade. Traffic-stress. Insects. Disease.**

Gras speaks volumes about any park, playground, golf course, commercial grounds, or private residential lawn. Maintaining a healthy appearance and desirable density is always challenging, especially in the summer when the grass is under constant stress from drought, heat, foot traffic, insects, and disease.

The ability to help withstand or recover from environmental and biological stressors is what makes Triple Crown Extreme™ Spreading and Drought Tolerant Tall Fescue Blend from Stover Seed particularly attractive to turf managers and landscapers.

True to its name, Triple Crown Extreme blends three of the newest and most drought-tolerant tall fescue varieties available: Aquaduct, AquaVita, and Rambler 2 SRP. Combined, they offer advances in turf quality that make this an extraordinary choice in grass seed – whether establishing new turf or overseeding existing turf.

Your grounds can look fantastic even during summer drought

Prized for its summer performance, Triple Crown Extreme can help you maintain grass quality and density even when drought, heat, and water-use restrictions are at their highest. As a qualified Turfgrass Water Conservation Alliance (TWCA) Turfgrass product, it offers documented water conservation benefits.

Beyond saving water, it can potentially maintain its coveted green appearance longer. Grass varieties in the Triple Crown Extreme blend were purposely chosen because, when tested against other tall fescues in different locations, they stayed greener for up to 30 days longer without added moisture.

Summer also invites other warm weather problems, like brown patch disease and insect infestation. That's why Triple Crown Extreme is endophyte-enhanced, making the grass insect- and disease-tolerant. It helps you keep the grounds healthy while spending less time managing these invaders.

This grass can self-recover from damage like divots, wear, and high foot traffic

Grass gets clubbed, cleated, trampled on, driven on, invaded by insects and disease—you name it! Fortunately for turf managers, rhizomes in the Triple Crown Extreme blend provide wear resistance and a potential for self-repair so it can recover from such damage. With its fast establishment and rapid spreading growth habit, it performs well as a living ground cover in areas under traffic stress.

Stover Triple Crown Extreme seed is proven successful in diverse geographic regions. The ability for self-repair makes it a top choice for high-traffic areas such as parks, playgrounds, commercial and residential lawns, cemeteries, and sod production.

When the grounds look good, you look good

No matter the type or size of property you are responsible for, the Triple Crown Extreme Tall Fescue

blend from Stover Seed will help you keep the grass healthy and looking good.

- Excellent wear tolerance and recovery with a rapid spreading growth habit
- Fast grass establishment due to excellent seedling vigor
- Better resistance to warm weather diseases like brown patch
- Endophyte enhanced for healthier grass that's insect and disease-tolerant
- Less shredding during mowing

Give yourself the advantages that Triple Crown Extreme is designed to deliver.
